

Low voltage AC drives

Complex cement challenges made simple
Reducing energy use
with superior process control

Worldwide more than 3,000 million metric tons of cement are used every year, with different types manufactured to meet various chemical and physical requirements. Producing this cement requires a clear understanding and careful control of the manufacturing processes. With over 100 years experience in the cement industry, ABB brings an unrivalled clarity of vision to the specific needs of the cement making process.

Automating the future

Recent years have seen a dramatic increase in the level of automation and, in particular, the use of low voltage AC drives within the cement industry. Automation leads to less man power, therefore less errors in production, while optimizing the process and making control easier and faster.

ABB drives – highly reliable, energy and cost efficient

AC drives are primarily used to adjust the speed and/or torque of standard AC motors. AC drives, together with induction motors, replace DC motors and slip-ring motors along with their control systems. AC drives also replace the need for starters, cascade drives, hydraulic speed control, mechanical gears, fan inlet vane control, fan damper control and many other techniques of regulating the speed of electric motors used throughout the cement making process.

AC drives bring substantial energy savings, reduced installation, operation and maintenance costs. The high reliability and reduced mechanical stress on electric motors leads to maximized uptime and greater productivity.

For over 30 years ABB has been supplying low voltage AC drives to the cement sector. Today, AC drives are used in a wide range of applications, some of which involve much more than just rotating the motor. The benefits include:

- Lower energy consumption, gas emissions and pollution levels
- Less investment in electrical network compensation devices, such as filters
- Reduced harmonic distortion to the electricity supply network

- Minimized mechanical wear of the equipment
- Higher process quality and reliability
- Better process equipment efficiency
- Increased productivity and throughput

How ABB can help

Throughout all stages of cement production ABB offers:

- Wide product range from pushbuttons to complete automation systems
- Versatile services from technical support to plant engineering
- Global presence and local support in over 100 countries

ABB drives - highly reliable, energy and cost efficient

ABB drives bring together a world leading and recognized brand which has carved a niche as a global number one supplier for variable-speed AC drives together with a product range from 0.18 kW up to 100 MW that is simply the widest available from any manufacturer.

ABB drives is a reference for drives users the world over and signifies reliability, simplicity, flexibility and ingenuity, throughout the life cycle of an AC drive.

For the cement industry, ABB manufactures motors and drive systems, from sub-kilowatt to megawatt ratings in low voltage and medium voltage ranges.

Flexible customer interface

- Easy connection to automation systems:
 - several fieldbus protocols available
 - same application program for a wide power range
- Drive's input and output signals can be used as they are, or modified depending on the application

- Parameter setting is extremely easy to use and understand
- Easy-to-use PC tools for drive programming and monitoring

Superior control accuracy and high dynamics

- The world leading motor control method, direct torque control (DTC), ensures extremely high control accuracy
- DTC behavior in abnormal situations is excellent, ie,
 - short supply voltage breakdown
 - heavy variations of torque
 - motor already rotating
 - cable short-circuits

Unrivalled energy efficiency

- Operating electric motors with variable-speed drives,
- Lower reactive power consumption
- High efficiency of 98 percent
- Minimized need for air conditioning in electrical rooms

Maximized uptime

- Preventive maintenance to avoid unplanned downtime
- Short repair time to minimize production losses
- Alarms before malfunction
- Drive diagnostics to help personnel to locate any faults

Applications

Stone crushers

Uninterrupted throughput with minimal maintenance

Crushing large limestone rocks causes considerable mechanical stress on the crusher and the motor. Prolonging the lifetime of the equipment and maximizing the uptime is easily achieved by controlling the speed and torque of the crusher motor by means of a low voltage AC drive.

ABB drives help relieve the enormous stress placed on stone crushers.

Reasons to select an ABB drive

Feature	Advantage	Benefit
Soft starting and reversing of motor	Lower starting currents and reduced mechanical stress during starting.	Savings through smaller sized cables and supply switchgear.
	Elimination of voltage fluctuations in supply network.	Less disturbances caused to various machines and equipment, minimized downtime.
	Minimized wear and tear of mechanics, means improved reliability and prolonged crusher lifetime.	Considerable maintenance savings and increased productivity.
Accurate speed regulation	Smooth reversing in case of blocked crusher.	High uptime of crusher and consistent production.
	Optimization of crusher speed and smooth change of direction of rotation.	Reduced operational and maintenance costs compared to slip-ring motor solutions.
Dynamic torque regulation	Reduced mechanical stress caused by high torque peaks.	Less maintenance and lower costs.
	High torque during start and operation if required.	High uptime and increased throughput.
Synchronizing of multiple motors	Equal distribution of load between the motors and elimination of undesirable dynamic effects.	Reduced maintenance costs. Elimination of unequal torque distribution and undesirable dynamic effects.
High power factor	Lower reactive power consumption and reduced need for compensation equipment compared to other control methods.	Lower installation costs and substantial energy savings.

Drives in action

ABB major partner in Vietnam cement plant

ABB has partnered Polysius in the construction of a 6,000 metric tons per day cement clinker production line in Vietnam. The plant, for the Thang Long Cement Joint Stock Company, a joint venture of the Vietnamese companies Lilama and Geleximco, is in the province of Quang Ninh, near Halong Bay about 150 km north-east of Hanoi.

As well as supplying the low voltage AC drives for the grinding mills, kiln and cooler fans, ABB supplied the high voltage and medium voltage power distribution equipment, motor control

centers (MCCs), low and medium voltage motors, cables and engineering, installation material, lighting and earthing equipment.

ABB was chosen for the contract for its reputation as a well known supplier of electrical and control equipment. Polysius supplied the main machines as well as the engineering for civil construction and structural steelwork; supervised the manufacturing and the assembly; and performed the commissioning. The company was also responsible for customer personnel training and technical assistance.

Applications

Conveyors

Prolonged belt lifetime and high uptime

Throughout cement making, numerous conveyors are used in demanding conditions, with the risk of belts stretching, slipping or breaking. Using low voltage AC drives protects the belts and other mechanical equipment by offering smooth and accurate control of the motor speed and torque.

ABB drives help protect conveyor belts from stretching, slipping or breaking.

Reasons to select an ABB drive

Feature	Advantage	Benefit
Soft starting and stopping	No belt stretching, slipping or breaking.	Prolonged conveyor lifetime, reduced maintenance costs.
Smooth reversing of direction of rotation	Easy maintenance in case of belt failure.	Minimized downtime, cost savings.
Accurate speed regulation	Optimization of conveyor speed. Reduced power consumption.	Prolonged conveyor lifetime, lower operational and maintenance costs.
Synchronizing of multiple motors	Equal distribution of load between the motors and elimination of undesirable dynamic effects.	Less wear and tear, resulting in less maintenance and smaller costs.
Regenerative braking	Braking energy is fed back into the plant electrical network.	Reduced utility bills.
Dynamic torque regulation	Enables high starting torque which can be precisely controlled at any time, yet preventing stretching and slipping of the belt.	Less maintenance and lower costs.

Drives in action

Challenge

With a difference in height of 273.8 meters at an inclination of up to 28 degrees to be overcome, Ciment Vigier, Switzerland, uses a two-conveyor system to transport limestone from its new deposit some 2,642 meters from the crusher on the hill top to its factory in the valley below. The aim is to save energy while using as few conveyors and transfer stations as possible.

Solution

The tubular belt conveyor is equipped with one drive pulley, two 160 kW squirrel cage induction motors and two ABB industrial drives. The second, the trough belt, is equipped with three, 160 kW squirrel cage induction motors and three ABB industrial drives. All five drives are coupled to the same supply unit in a common DC busbar arrangement. This construction simplifies the total installation and saves cabling, reduces line currents, simplifies the braking arrangements and enables energy circulation over the common DC busbar. The 350 kW

of braking power that is generated, is transferred to the mains by means of an energy recovery unit, significantly reducing the energy consumption of the complete system.

Benefits

- The drive system harnesses the energy produced by the descending continuous conveyor system and feeds this back into the supply, saving energy.
- To reduce the spare parts stock, identical motors and drive systems are used.
- Using an ABB multidrive common DC bus ensures optimal load distribution on the individual drive units for different operating conditions. This enabled ABB to minimize the resulting belt tensile forces, while at the same time maintaining the belt forces necessary to transmit the required drive power in both driven (generator) as well as driving (motoring) operation.

Applications

Feeders

Required cement quality through accurate dosage of materials

Accurate and controlled dosage of raw materials and additives is crucial to the quality of the cement. It is also important to avoid stretching, slipping and breaking of feeder belts.

Controlling the speed and/or torque of feeder motors with low voltage AC drives ensures precise material dosage which is under continuous control. AC drives enable precise information on the dosed amounts of materials. Using AC drives also protects the feeder belts and other mechanical equipment by offering smooth and accurate control of the motor speed and torque.

Precise raw material dosage using ABB drives enhances cement quality.

Reasons to select an ABB drive

Feature	Advantage	Benefit
Accurate speed and torque regulation	Precise dosage of materials. Detailed information on the dosing process. Elimination of mechanical dosing systems.	Desired cement quality, consistent process quality. Optimized consumption of fuel, raw materials and additives - minimized gas emissions. Low operational and maintenance costs, high process uptime.
Flexible user interface	Easy connection to any automation system through multiple fieldbus adapters and a high number of inputs and outputs.	Reduced installation costs, minimal need for programming.
Soft starting and stopping	No belt stretching, slipping or breaking.	Prolonged feeder lifetime, reduced maintenance costs.

Applications

Grinders

Less wear and higher reliability for increased efficiency

Grinding raw material and clinker causes considerable wear to the grinding mill. Starting the grinder, direct-on-line, stresses the grinder and the gearbox, increasing the risk of gearbox failure as well as shortening the lifetime of mechanical equipment. The use of low voltage AC drives helps optimize the grinder speed to match the material flow, thus minimizing the wear of the grinder. Furthermore, the mechanical stresses during starting are eliminated.

Grinding is an area where energy use is high. In addition, the efficiency of grinding mills is low. Optimizing the grinder speed by using AC drives ensures efficient use of energy and an improvement in the overall efficiency of the grinding process.

ABB drives can be used to control the speed of permanent magnet motors in applications running at low speeds. This enables using gearboxes with simple and robust construction.

Vertical and horizontal grinders can benefit from the use of ABB drives.

Reasons to select an ABB drive

Feature	Advantage	Benefit
Soft starting	Low starting currents and eliminated mechanical stress during starting.	Prolonged grinder lifetime. Reduced maintenance costs.
Speed regulation	Optimized grinder speed, minimized wear of the grinder.	Considerable savings in maintenance costs. Improved energy efficiency. Reduced reactive power consumption.
Permanent magnet motor speed control	Ability to use simple and robust gearboxes.	Savings in investment, installation, operational and maintenance costs.
Grinder measurements: various grinder operational values measured and relayed to plant automation systems	No need for external measuring devices.	Savings in investment and maintenance costs.

Applications

Separators

High quality cement through consistent separation

Separators are crucial elements of the cement making process, having a major impact on the quality of cement as well as energy consumption. Adapting the separation to the overall process characteristics, such as material, gas flows and size of particles, requires precise and rapid speed control of the separator motors. The high inertia of the separators requires braking in order to achieve rapid speed reductions or to stop the separators.

Low voltage AC drives enable fast and accurate separator speed control, which ensures a consistent separation, resulting in high quality cement.

ABB drives offer both resistor braking and regenerative braking, where braking energy is fed back into the mains, thus lowering the consumption of energy. The main source of energy savings, when compared to traditional control methods, are AC drives.

A more accurate separator control also improves the efficiency of the grinding process.

ABB drives contribute massively to energy savings of separators.

Reasons to select an ABB drive

Feature	Advantage	Benefit
Accurate speed regulation	Optimization of separator speed. Reduced energy consumption.	Consistent cement quality. Lower operational costs.
Regenerative braking	Braking energy is fed back into the mains.	Lower energy bill.
Flying start	Separator can be started when spinning.	Time savings through immediate starting and no need for braking.

Applications

Kilns

Continuous operation and superior process control with minimized energy consumption

Kilns, being at the heart of the cement making process, require reliable and high performance motors and drives in order to ensure continuous operation in varying conditions. This is the area where capital costs are highest, fuel demands are largest and process control is crucial.

ABB drives, with direct torque control (DTC), offer proven reliability as well as state-of-the-art torque control and superior speed control accuracy, ensuring uninterrupted and stable running, irrespective of the kiln speed or the kiln load.

Power supply failures and other special occasions result in the need to restart the kiln. Restarts, requiring a very high starting torque, are easily achieved with DTC.

The multitude of different fieldbus adapters available for ABB drives, together with the drives superior control characteristics, enables accurate control of the kiln, thus optimizing the fuel consumption and the production flow.

ABB drives' DTC plays an important role in the efficient running of kilns.

Reasons to select an ABB drive

Feature	Advantage	Benefit
Accurate speed regulation	Optimization of kiln speed and production flow. Reduced mechanical wear of the kiln and other equipment.	Minimized cost of fuel and electricity, maximized production volume. Minimized maintenance costs.
Dynamic torque regulation	Reduced mechanical stress caused by high torque peaks. High torque during start and operation if required.	Less maintenance and lower costs. High uptime and increased throughput.
Eliminate motor maintenance	AC is preferable to DC because of the dusty outdoor motor/tachometer environment. Cement dust greatly increases DC brush wear. The totally enclosed frame of the AC motor is much more suited to cement environment.	Maintenance costs substantially reduced.
High power factor	Lower reactive power consumption and reduced need for compensation equipment compared to other control methods.	Lower installation costs and substantial energy savings.
Master-follower software	Equal distribution of load between two kiln motors.	Reduced maintenance costs.
Multitude of fieldbus adapters available	Easy connection to various automation systems, thus no need for extra adapters or other devices.	Savings in installation and minimal need for programming.

Applications

Fans

Precise gas flow with minimized energy consumption

Irrespective of the fan application, there is always a need for precise control of the gas flow. This is valid for both the cooling air and the gases produced by the cement making process itself. Accurate control of the gas flow has a key role in securing a consistent cement quality. As to energy consumption, fans are the biggest source of energy saving, provided that they are efficiently controlled.

The most accurate control of the gas flow is achieved by controlling the speed of the fan motors by low voltage AC drives. ABB drives incorporating direct torque control (DTC), provide excellent speed control plus have a wide variety of features suited to fan applications. Controlling the fan speed with AC drives is the most energy-efficient control method, ensuring significant energy savings compared to any other control method.

ABB drives can provide the biggest energy saving potential for fans.

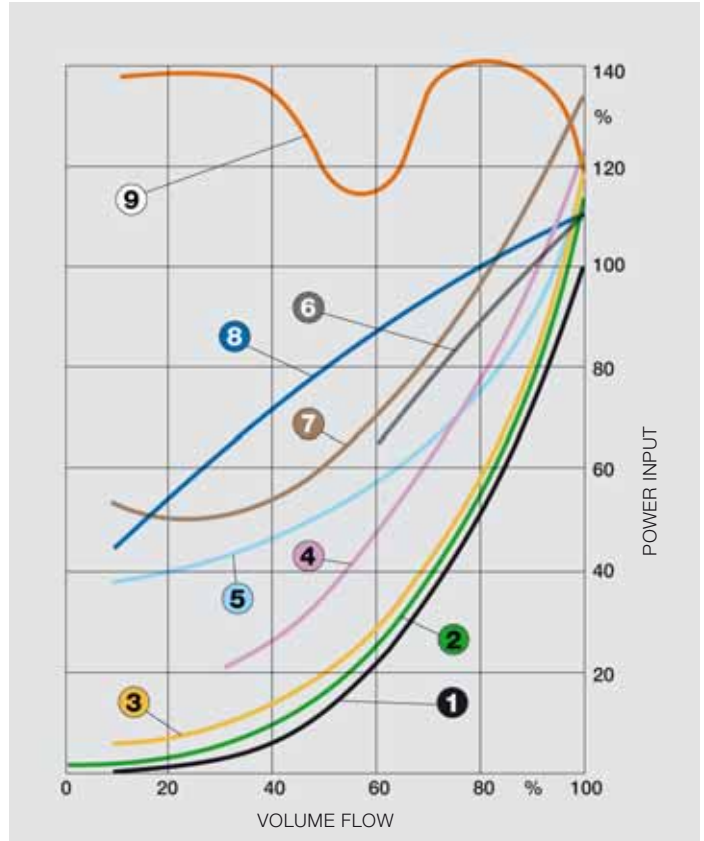

Reasons to select an ABB drive

Feature	Advantage	Benefit
Accurate speed control of the fan motor	Can vary air flow according to process conditions Prolonged fan lifetime. Reduced consumption of raw material and smaller amount of waste. Lower noise level of the fan.	Consistent cement quality, improved customer satisfaction. Savings in maintenance costs. Substantial cost savings and minimized emissions. Safer and a more comfortable working environment.
Soft starting	Elimination of high starting currents and reduced mechanical stress during starting. Avoids too high or low gas pressures, minimizing mechanical stresses. Prolonged fan lifetime.	Savings through smaller sized cables and supply switchgear. Maximized process uptime and savings in maintenance costs. Savings in maintenance costs.
High efficiency	Efficient use of electrical energy, ie low power losses.	Reduced energy costs, improved environmental friendliness.
Flying start	Fans can be started when spinning.	Time savings through immediate starting and no need for braking.
Power loss ride-through	Uninterrupted operation of drive and motor in power failure situations, with no need to restart the drive when the supply voltage is restored.	Time savings.
Jump-over of critical frequencies	Speeds causing mechanical resonance are automatically skipped.	Prolonged fan lifetime, considerable cost savings.
High power factor	Lower reactive power consumption and reduced need for compensation equipment compared to other control methods.	Lower installation costs and substantial energy savings.

Applications

Fans

- 1 Required fan power
- 2 Speed control by AC drive (both for centrifugal and axial-flow fans)
- 3 Variable pitch angle (for axial fans only)
- 4 Fluid coupling (slip control)
- 5 Inlet vane control (for centrifugal fans with backward-curved impeller)
- 6 By-pass control (for axial fans)
- 7 Damper control (for centrifugal fans with forward-curved impeller)
- 8 Damper control (for centrifugal fans with backward-curved impeller)
- 9 Damper control (for axial fans)

Power consumption of fan installations with different control methods.

Drives in action

Challenge

A series of surveys at Castle Cement's Ribblesdale cement works in the UK discovered local weather and topographical conditions occasionally caused the plumes of chimney gases from kiln seven to fall to ground prematurely, resulting in sulphur dioxide odours at ground level.

Solution

Two fans are being controlled by an ABB low voltage AC drive, comprising two inverter units fed by a common DC bus from a single rectifier, together with two AC motors and a 2000 kVA phase-shift transformer.

Each motor powers an ABB fan by means of one 1700 kW ABB drive, which is housed in the scrubber plant's switch room. The drive solution allows a single transformer from the plant's supply to provide a common DC bus for the control of both the scrubber fans.

The first fan is located at the end of the scrubber unit and is turned by a 1100 kW ABB AC motor.

The speed of the 4 meter diameter fan is governed by the ABB drive, which in turn is connected to a PLC in the main plant control room. The PLC monitors a pressure control loop and maintains a negative inlet pressure of two millibars. This ensures that the exhaust gases are drawn through the scrubber unit from the main stack at a rate of around 296,000 m³/hour.

The second fan, driven by a 395 kW ABB AC motor, reclaims heat from the kiln-cooling grate by drawing in atmospheric air. This hot air is then mixed with the saturated gas exiting the scrubber prior to it being released to the chimney.

The hot gas, delivered at 240,000 m³/hour and 250 °C, ensures better plume dispersion and reduces the chances of water condensation inside the stack.

Benefits

Accurate speed control of two fans within a chimney gas scrubber, has helped to virtually eliminate sulphur dioxide emissions and reduce overall emissions by 45 percent.

As the premier company for low voltage AC drive technology, ABB has amassed a wealth of knowledge and expertise on all aspects of drive systems throughout the cement and other industrial sectors. ABB has dedicated experts who understand all details of cement industry applications; talk your language; and can offer the quickest route to a profitable solution, without forgetting personnel safety and environmental responsibility. Here's how:

Leading technology in design and production

For over 100 years, ABB has consistently invested a large proportion of its turnover in research and development, working closely with some of the world's leading universities and institutions. The result is the most advanced range of low voltage AC drives in the market, designed to meet the specific needs of various cement industry applications. This has also led to several patents for leading edge technology within ABB drives.

ABB's reputation is further enhanced through its work with world leading authorities and legislative bodies. This cooperation contributes to the safety of ABB's products and thus the personal safety of the users.

Cooperating with its sub-suppliers, ABB can exploit the latest component technology when designing its drive products. This results in improved quality of ABB's drive products and in enhanced component quality.

ABB's drive manufacturing facilities are equipped with the most modern production lines using the latest production techniques and advanced software. Precision robots combined with fully automated material flow and testing routines ensure high quality of products and short throughput times.

As part of its supply chain management, ABB is the first company in Europe using radio frequency identification (RFID) of components which considerably improves product quality and traceability.

Product reliability is further enhanced through stringent quality control procedures with all manufacturing facilities operating to ISO 9001. Identical manufacturing facilities are located in Finland, the USA, China, India and Estonia.

Complete technical advice from selection to operation

ABB constantly monitors all legislation, regulations, directives and standards, not only ensuring that its products comply but by offering sound advice to customers. Examples of directives guiding the design and use of AC drives are the European EMC (electromagnetic compatibility) directive and the low voltage directive.

Another example is ATEX, which became mandatory in July 2003. ATEX is the European regulation covering equipment intended for use in potentially explosive atmospheres. ABB is one of the first companies to gain blanket ATEX certification for its ABB industrial drives and flameproof and non-sparking motors, for use in hazardous areas. By gaining the blanket certification, ABB provides combined ATEX-approved drives and motors packages that do not need further testing on site.

ABB's expertise extends throughout a cement plant's entire electrical installation. ABB's engineers can advise on the correct selection, dimensioning, installation, operation and maintenance of drives, motors, transformers, relays, switches, contactors through to transducers and meters. Advice is available on long cabling, weak networks, protection functions, harmonics, EMC, power factor correction, mounting options and air flow requirements.

Using harmonic filters developed by ABB eliminates the severe plant disruptions caused by harmonic disturbances in electrical equipment. ABB offers proven ways to assess the users' vulnerability to harmonic problems and the need for filters.

In cement plants, the consumption of inductive reactive power is significant. Reactive power compensation equipment offered by ABB helps minimize the amount of reactive power.

In many applications there is a need to interface the drives with external systems. ABB has the expertise in all high performance communication protocols including PROFIBUS DP, Devicenet, CANopen and Modbus fieldbus.

ABB offers knowledge-based publications which include a series of detailed technical guides covering harmonics, EMC, bearing currents and motor control platforms, through to single page FactFiles, offering the latest thinking on topical subjects. These, and much more, can be downloaded from www.abb.com/drives.

Thorough process know-how for improved competitiveness

Not only is ABB the leading supplier of low voltage AC drives, but it has also built a formidable knowledge databank of all applications from stone crushers and kilns through to grinders and conveyors.

This know-how has been honed in tackling many unusual applications across a variety of industries. As such, ABB boasts that no application is beyond its experts. Today, ABB has created an enviable team of dedicated industry specialists whose focus is on their chosen industry but who share the knowledge from other sectors to their benefit.

This pioneering spirit has its roots in the 1970s when ABB developed the very first high-power AC drive. In subsequent decades ABB has led a technology revolution which has been driven by the needs of its customers. ABB is recognized as the world's leading application engineering organization.

ABB's advice covers all aspects of process control and focuses on increasing production capacity, improving end product quality, reducing waste and reducing maintenance costs.

Sustainable development for people and the environment

With around one percent of the world's electrical energy used in crushing and grinding cement, all cement producers experience financial and environmental pressures to reduce energy consumption.

One of the biggest benefits of using AC drives is the energy saving opportunity over fixed speed motors. As such, ABB is a world leader in assessing the energy saving potential within all industries.

A structured process that includes an energy appraisal, coupled with a series of energy saving tools, have been devised to ensure that customers see the benefits of changing to AC drives. Greenhouse gases are also reduced thanks to AC drives.

ABB has devised a replacement drive scheme for upgrading older, inefficient drives for new, space saving and highly efficient drives. Following an assessment of a plant, ABB helps select a replacement drive with improved efficiency and features for the application.

In some countries, ABB is able to remove the redundant drives, regardless of the original manufacturer and ensure that they are disposed of in accordance with the latest world standards. ABB's commitment to the environment means that old drives are recycled whenever possible. All new products, even the packaging, are designed for recycling.

The ISO 14001, international environmental management standard, has been implemented and the Finland factory is certified since 1996. Life cycle assessment is applied continually to all product development. All certificates and declarations relating to environmental issues can be found at www.abb.com/drives.

Health and personnel safety is a fundamental part of ABB's commitment to sustainability. ABB cares deeply about how its operations and products affect its employees, customers, contractors and neighbours.

Many of the industries in which ABB works – often on customer sites – are by their nature very challenging and accordingly ABB operates to the highest standard of occupational health and safety excellence and remain constantly vigilant in carrying out its duty of care.

ABB's ultimate aim is to prevent all accidents, injuries and occupational illness through the active participation of its customers, contractors and employees.

The successful management of safety starts with the involvement of everyone, from the CEO to ABB's front line workers in a systematic and continual focus on hazard recognition and mitigation.

ABB's combined efforts and commitment allows it to achieve a continuing improvement in its safety record.

Extend your choices by ABB authorized value providers

The ABB authorized value provider network provides more choices and flexibility when buying ABB products and services.

The network members deliver sales, support, service and engineering in seamless cooperation with ABB.

ABB authorized value providers are members of the ABB channel program – the ABB Value Provider Program. They are fully trained, regularly audited and officially authorized to represent the defined ABB products and services. With their in-depth knowledge of local markets and expertise in selected products and services, they can ensure speed, efficiency and consistency in daily operations. Their work ensures that ABB products are backed by the same high standards of service and support all over the world.

Products and services for your specific needs

The multichannel network offers more choices and flexibility to match the local business requirements via globally consistent offering.

Finding your local ABB authorized value providers

(*) Optional

This label is a sign of quality services from the official members of the ABB Value Provider Program.

ABB has the largest service team of all drives suppliers. Field service engineers with experience within the cement industry are located worldwide.

One of ABB's key objectives is to maximize the uptime of its customers' processes by ensuring reliable operation and optimum lifetime of all ABB products in a predictable, safe and low-cost manner.

The services offered for ABB low voltage drives span the entire value chain, from the moment a customer makes the first enquiry to disposal and recycling of the drive.

Among the benefits of using ABB drive services are higher reliability, lower operational costs, improved productivity, reduced environmental impact and enhanced safety.

Energy appraisal

The increasing interest in AC drives in the cement sector is partly due to a greater awareness of energy issues and rising energy prices. In many countries, ABB offers energy appraisals that can rapidly determine just where and how much energy can be saved.

Power savings up to 50 percent can be reached by reducing the motor speed by just 20 percent, with payback as short as six months.

Harmonic survey

ABB collects data on harmonic currents and voltages interfering with the electricity supply network and details actions to minimize them.

Selection and dimensioning

Whatever the cement application, ABB's vast experience will help in the correct selection and dimensioning of the drive. This ensures the correct drive installation, powerful enough for your motor requirements.

Installation and commissioning

ABB's certified engineers install and adjust the drive according to the application requirements as well as instruct the user on how to operate the drive. All commissioning information and the production parameters are saved, should the engineer need to restore any information at a later date.

Training and learning

ABB offers dedicated drives training for service and operating personnel to acquire the skills to use ABB drives correctly and safely.

Technical support services

Technical support services provide accurate, consistent and responsive information and support to all ABB customers.

Maintenance and repair

ABB recommends regular preventive maintenance throughout the lifetime of drives.

Maintaining drives in accordance with the maintenance schedules, ensures maximum availability, minimum repair costs, optimized performance and extended lifetime of the drive.

Drive preventive maintenance (PM) consists of annual drive inspections and component replacements according to the product specific maintenance schedules, using PM kits which contain all the service parts and materials defined for a certain preventive maintenance.

Maintenance can be performed on a contract basis.

ABB's certified engineers provide maintenance and repair services on site and in authorized ABB drive service workshops.

Workshop services

Instead of performing maintenance or repair on site, modules can be sent to an ABB drive service workshop. In case of repair, it is often practical to recondition the drive at the same time.

All work is performed by ABB certified personnel in dust-free, electrostatic discharge protected areas. Before repair, the drives are thoroughly cleaned, and after repair, fully tested.

Spare part services

Genuine ABB factory-certified drive parts are delivered quickly worldwide. They guarantee full compatibility and are available throughout the drive lifetime following the drive life cycle plan.

Spare part services include:

- Web based spare part information and ordering system - for quick and easy access from your PC, around the clock.
- Conventional spare part service - contact your local ABB representative for spare part orders.
- Preventive maintenance kits - contain all the replacement parts for a scheduled maintenance.
- Drive exchange service - a convenient and fast way to fix a problem with a drive is to order an exchange module. A reconditioned drive is immediately shipped to the customer (subject to availability). The defective but repairable unit is returned to ABB.
- Inventory Access - an ABB owned and maintained spare part inventory at the disposal of a customer. This spare part inventory is usually located at the customer's site or at an ABB location. This service provides the customer with up-to-date spare parts with no capital investment for a fee that is based on the inventory value and duration of the contract commitment.

Upgrade and retrofits

Drives upgrade and retrofit offerings are designed for improved performance and extending the lifetime, often resulting in the best possible return on your drive assets.

Replacement and recycling

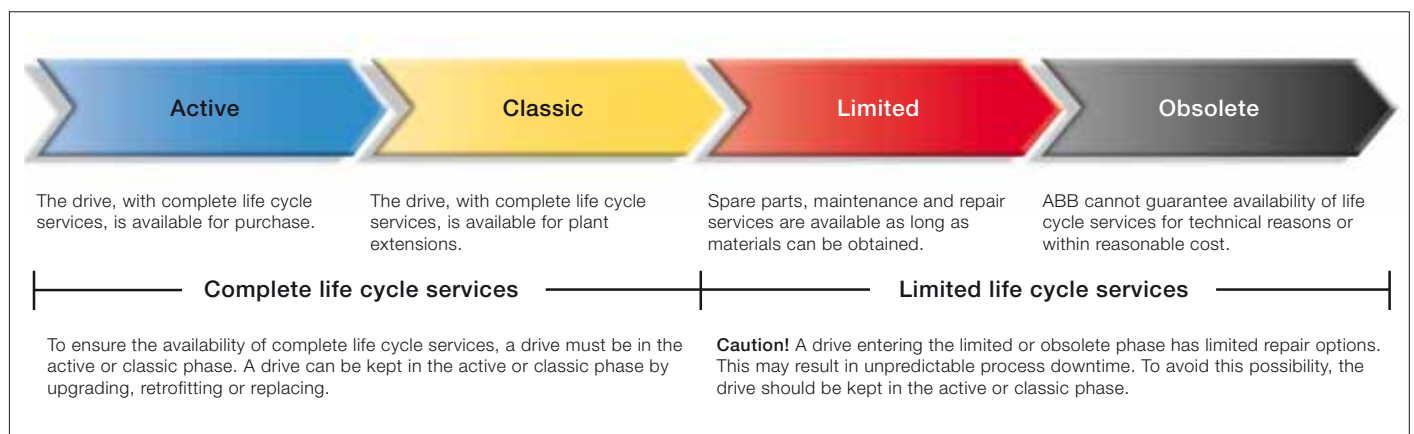

ABB's replacement drive scheme provides a correctly dimensioned drive, while disposing of old equipment. The scheme covers any drive or motor, regardless of the original manufacturer.

Secure uptime throughout the drive life cycle

ABB follows a four-phase model for managing the life cycles of its drives. The life cycle phases are active, classic, limited and obsolete. The services offering is defined for every drive separately. The availability of individual services depends on the drive's life cycle phase.

The four-phase drive life cycle management model provides customers with a transparent method for managing their investment in drives. In each phase, customers clearly see what life cycle services are available, and more importantly, what services are not available. Decisions on upgrading, retrofitting or replacing drives can be made with confidence.

ABB drive life cycle management model

Low voltage AC drives for cement

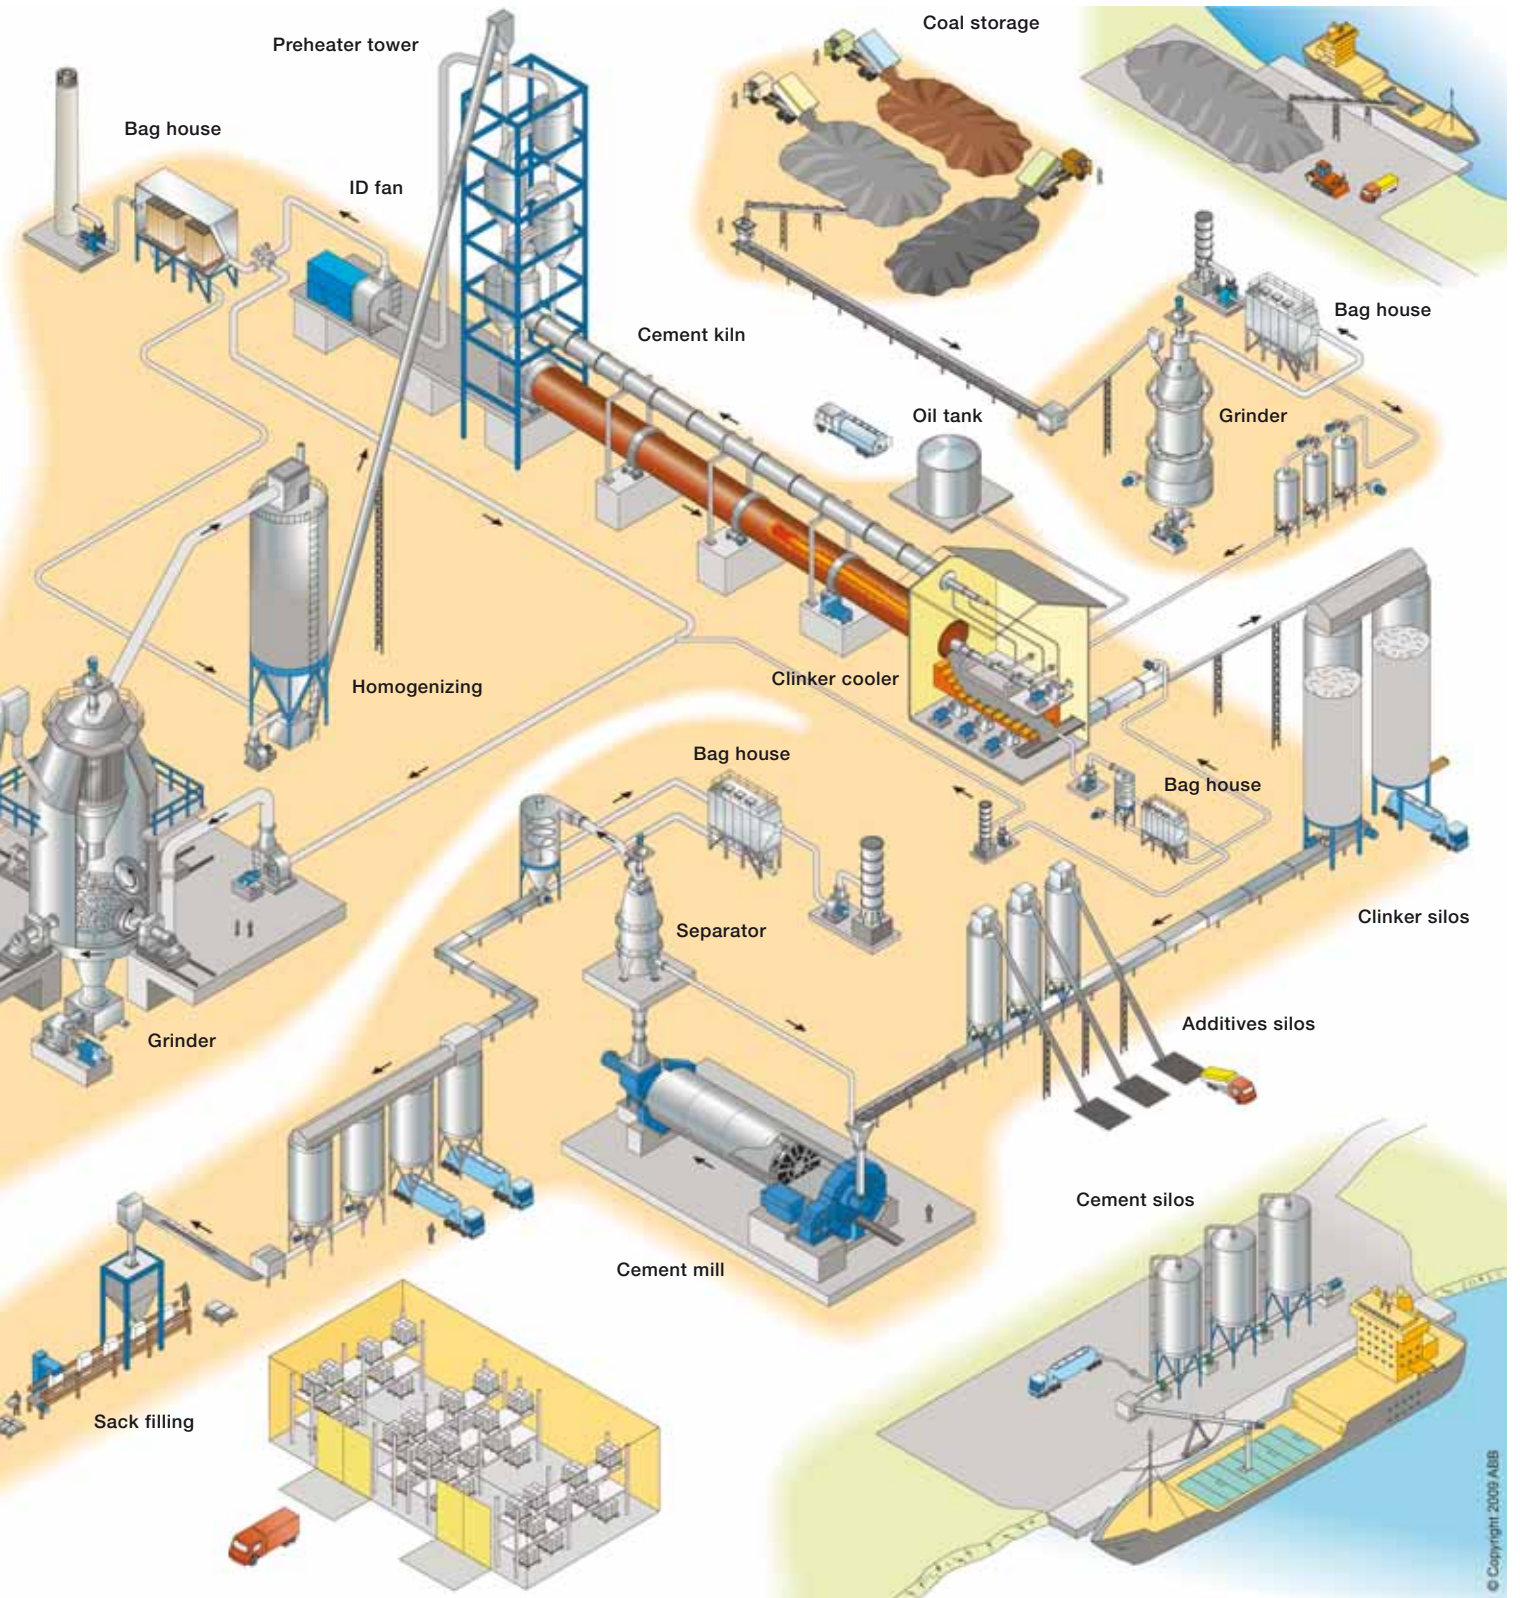

When tough environments need tough control

While ABB drives are used extensively in pump and fan applications, the cement industry has a whole array of more demanding challenges from the crushing of heavy limestone, and the high stresses this places on motors, to the continuous operation and superior process control demanded by kilns. In between lies a host of other strict application demands from grinders and separators to conveyors. For ABB drives these are simply every day challenges.

One thing all these applications have in common is the opportunity for substantial energy savings. Here the highly reliable ABB drives do not disappoint, and they also reduce installation, operation and maintenance costs. All of which leads to maximized uptime and greater productivity.

ABB drives are backed by unprecedented application know-how and the assurance that the drive installation will be looked after throughout its life cycle with ABB's comprehensive services offering.

ABB in cement

Your partner throughout the cement production process

From a critical component to a complete electrification project, ABB is the single source for automation systems and solutions, electrical equipment and a vast variety of services, including engineering and plant maintenance services.

Power transmission and distribution systems

ABB offers a complete portfolio of solutions, systems and equipment for the efficient transmission and distribution of electricity. Also available is a wide variety of services for network management. Furthermore, ABB can optimize your energy asset utilization and contribute to the profitable operation of your business.

Equipment for high quality of power

To eliminate the severe plant disruptions caused by harmonic disturbances in electrical equipment, ABB delivers modern filters.

Reactive power consumption can be minimized by using ABB power factor compensation equipment. This results in significant savings.

Motors and generators

As a leading supplier, ABB offers a wide range of motors and generators for every application.

Thanks to their high efficiency and robustness, the efficiency of the cement making process is maximized.

Automation systems, solutions and services

In addition to world-class electrical equipment, ABB offers leading solutions, such as control and knowledge systems for economic process optimization. ABB ensures results for its clients by offering a range of services, including engineering and plant maintenance.

Engineering

ABB uses an integrated team approach to produce professional engineering documentation, designing the electrical interfaces with its client's appointed consultants, engineers and mechanical and civil partners.

Electrification

ABB provides the planning and supervision of the site staff to ensure short, effective and standardized procedures. Stores are organized for incoming goods. Insurance, safety and transport matters are settled before they become issues.

Process control

Scalable automation solutions provide easy entry to benefit from next-generation automation products. A small, basic system can be rapidly extended into a fully integrated and optimized automation solution, to deliver even greater value.

Existing ABB customers have access to a range of migration plans, designed to modernize existing plants in structured steps. Customers, who want to switch to added value ABB solutions, can easily migrate to modern, integrated process

automation, thanks to ABB's standardized product ranges that can be tailored to their needs. Communication protocols such as OPC, PROFIBUS, Foundation Fieldbus, HART and Modbus bring easy, economical interfacing with a wide range of third-party products.

Knowledge systems

ABB's knowledge systems provide the best-in-class manufacturing operation through to efficient dispatch of final product.

Using ABB's extensive solutions portfolio, the data from the customer's process control system is collected and converted to production information. Together with extensive process knowledge and proven advanced control techniques, this information is used to monitor and optimize the process to improve process efficiency and product quality.

Optimization systems

ABB's suite of optimization solutions, allow cement customers to reach new levels of plant performance.
